

Noise and bias-variance

Recall the decomposition:

$$\mathbb{E}_{\mathcal{D}} \left[(g^{(\mathcal{D})}(\mathbf{x}) - f(\mathbf{x}))^2 \right] = \underbrace{\mathbb{E}_{\mathcal{D}} \left[(g^{(\mathcal{D})}(\mathbf{x}) - \bar{g}(\mathbf{x}))^2 \right]}_{\text{var}(\mathbf{x})} + \underbrace{\left[(\bar{g}(\mathbf{x}) - f(\mathbf{x}))^2 \right]}_{\text{bias}(\mathbf{x})}$$

What if f is a noisy target?

$$y = f(\mathbf{x}) + \epsilon(\mathbf{x}) \quad \mathbb{E} [\epsilon(\mathbf{x})] = 0$$

A noise term

$$\begin{aligned}\mathbb{E}_{\mathcal{D}, \epsilon} \left[\left(g^{(\mathcal{D})}(\mathbf{x}) - y \right)^2 \right] &= \mathbb{E}_{\mathcal{D}, \epsilon} \left[\left(g^{(\mathcal{D})}(\mathbf{x}) - f(\mathbf{x}) - \epsilon(\mathbf{x}) \right)^2 \right] \\ &= \mathbb{E}_{\mathcal{D}, \epsilon} \left[\left(g^{(\mathcal{D})}(\mathbf{x}) - \bar{g}(\mathbf{x}) + \bar{g}(\mathbf{x}) - f(\mathbf{x}) - \epsilon(\mathbf{x}) \right)^2 \right] \\ &= \mathbb{E}_{\mathcal{D}, \epsilon} \left[\left(g^{(\mathcal{D})}(\mathbf{x}) - \bar{g}(\mathbf{x}) \right)^2 + \left(\bar{g}(\mathbf{x}) - f(\mathbf{x}) \right)^2 + \left(\epsilon(\mathbf{x}) \right)^2 \right. \\ &\quad \left. + \text{cross terms} \right]\end{aligned}$$
